\* Your service provider must enable and continue the connection from your set top box or DVR to the QuickView Expander external hard drive to operate.

## QuickView Expander

160GB 300GB

Digital Video Recorders (DVRs) are revolutionizing the way people watch television, offering unprecedented control over how and when you watch. DVRs are so useful that users can quickly fill them up, saving programs for a weekend movie marathon or Superbowl extravaganza. The Maxtor QuickView Expander™ is the industry's first external hard drive that instantly adds more recording hours to your DVR or set-top box by attaching to your already installed DVR\*. Like all good ideas, it seems obvious, now that somebody's thought of it.

The QuickView Expander external hard drive provides up to 160 hours of high-speed storage for set-top boxes equipped with external Serial ATA ports. The drive takes advantage of the Maxtor QuickView storage technology that powers most of today's DVRs. Maxtor QuickView hard drives are designed for streaming media applications and offer exceptional performance and advanced features that enhance the digital entertainment experience.

### How does it work?

The QuickView Expander external hard drive attaches to your DVR or set-top box. First, contact your service or cable provider to confirm availability in your area. Once you receive your new QuickView Expander external hard drive, simply plug the drive into a wall outlet and connect it to your DVR to prepare for the ultimate entertainment experience!

### For content providers

Why not offer a more efficient DVR product line while saving on developmental costs, production costs and inventory costs? Modular storage lets your customers offer a single model with either no storage or a small amount of storage on board. The QuickView Expander external hard drive then allows end users to buy storage as a separate, easily connected component.

Modular storage is the kind of differentiating feature that can set your DVR solutions apart.

Included in the box
