- Simpler, easier deployment
- High-capacity, highly available object storage solution
- Flexibility and transparency with open source object storage software

Leading-edge workloads and applications require tremendous amounts of data to be effective.

Technologies like the Internet of Things (IoT), edge computing, big data, and artificial intelligence (AI) are proliferating, and while the use of consumer endpoint devices is rising rapidly. These are just two of many factors that are driving the explosion of data. Two concepts help us better understand data proliferation: growth and sprawl. Data growth refers to the percentage by which the datasphere increases over time. Sprawl describes the spread of this growing data throughout various configurations—from endpoint to edge to cloud. Data growth has been and will continue to be unprecedented in volume, whereas data sprawl represents how data is scattered.

We live in an exciting era of innovation and opportunity. At the same time, we live in an era of unique challenges. Advances in AI are unlocking opportunities and solutions to critical challenges in almost all fields of human endeavor. Whether it's improving our health with custom DNA diagnoses or making roads safer with autonomous vehicles, data, more than ever, is poised to transform our world in unimaginable ways.

## The Challenge

With so much data generation, organizations are struggling to leverage the full extent of their data for business insights and better decision-making. This is primarily because of the difficulty associated with storing and accessing that growing data. Organizations are tasked with managing the data they currently have, as well as the large volumes of data they will continue to receive. And if they are unable to tap into that data, they will miss out on opportunities to better understand customers, obtain competitive advantage, prevent fraud, and optimize supply chains. Smart management of the ever-growing troves of information requires that organizations understand how and where their data is gaining in volume.

Many of the leading-edge technologies that businesses are using require enormous amounts

of data in order to be effective. A key driver of AI enhancement has been innovations in machine learning (ML)—the technique by which machines are trained to act autonomously—and corresponding innovations in analytics, which enable us to discover hidden insights. But the use of existing storage software infrastructure and parallel file systems delays time to insights. Object storage, on the other hand, can support many of these modern workloads by handling unstructured data, retrieving data faster, and being cost-effective.

That said, object storage software needs an ideal hardware and infrastructure platform to leverage its full potential. Currently, many object storage solutions are difficult to deploy, proprietary, and cost-prohibitive.

As the cost of data storage continues to rise, bytes of data remain difficult to access. Converting mass-capacity hard drives into consumable data in data centers requires a tremendous amount of overhead. In fact, costs are so high that the International Data Corporation (IDC) predicted less than 10 percent of the 175ZB of data produced in 2025 will actually be stored with today's storage technology. This untapped data represents an enormous amount of lost opportunity.

## The Solution

Object storage has innovative characteristics that make it highly suitable for customers deploying modern workloads that require lots of data, such as AI, big data, high-performance compute (HPC), and edge data centers.

Customers need affordable object storage solutions that are easier to configure; ones that use denser storage, have a tighter integration of software and hardware, and are based on open standards.

Lyve Drive Rack is an object storage, converged infrastructure solution that solves many data management challenges by storing large amounts of unstructured data. The integrated software and hardware bundle includes storage, compute, networking, and object storage, along with many third-party tools and applications. CORTX was co-designed by Seagate and development partners who validated existing concepts and suggested new features, yielding an

open, community-driven approach.

CORTX is 100% open source, with the core utilizing Apache Licensing Version 2—one of the least restrictive open source licensing models. Lyve Drive Rack democratizes data access by making object storage software open and affordable, enabling organizations to deploy more storage so they can store and access more of their data.

### Artificial Intelligence and Machine Learning

AI and ML applications need a tremendous amount of data to be effective. With larger data sets for AI/ML training models, inference engines can provide deeper levels of insight. Lyve Drive Rack's high-density, high-capacity storage enhances this process. Further, CORTX was designed from the ground up for AI/ML—with research and scientific organizations contributing many cutting-edge use cases, as well as validating and suggesting new features to support AI/ML requirements.

### Big Data

Big data is characterized by lots of unstructured data that is difficult to manage and costly to access. Object storage can store unstructured data in native formats, making it available for use in big data analytics, creating data lakes, and supporting newer tools and technologies.

### HPC

HPC environments are capacity intensive, with users needing fast access to large amounts of data, high availability, and stringent data protection. This makes HPC environments ideal for object storage and Lyve Drive Rack.

## Total Solution

Lyve Drive Rack solves many challenges around deploying object storage software, simplifying the build-out of mass capacity storage solutions using fully tested, pre-configured architectures with a single-pane-of-glass management. A highly reliable and efficient enterprise-class solution, Lyve Drive Rack's high-density drives enable customers to store more data at a lower cost.

CORTX is installed and tested with Lyve Drive Rack and supported by Seagate, and is an object storage software that ingests and stores the large amount of structured and unstructured data being generated by enterprises, governments, and other businesses. CORTX is 100% open source, so customers benefit from transparency, open source licensing, and the flexibility to adapt

the code. CORTX provides an open, community-based framework for object storage. CORTX is the certified, supported, and indemnified version of CORTX community.

Lyve Drive Rack can be bought via traditional or subscription licensing. CORTX utilizes Apache License, Version 2.0 for its core and AGPLv3 for peripheral components.

## Reference Architecture

Lyve Drive Rack converged infrastructure tests various components together to deliver an enterprise-class object storage solution. The base reference architecture is shown below in Figure 1.

FIGURE 1

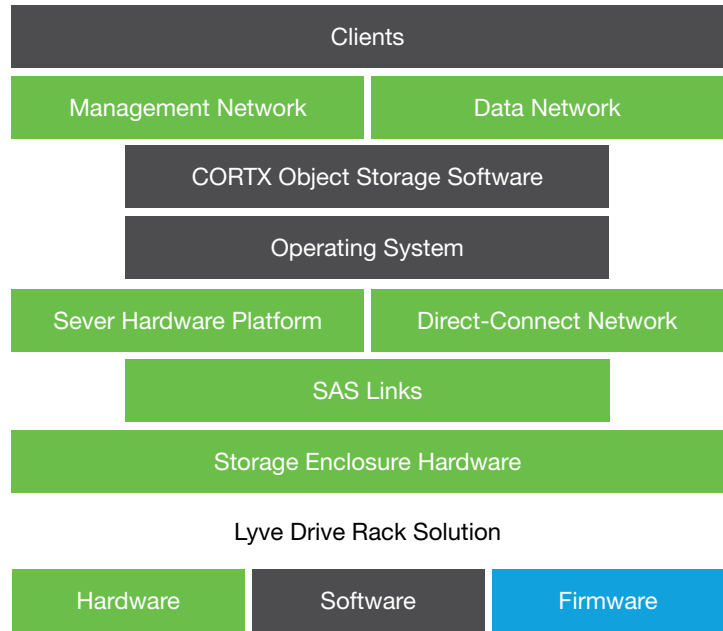

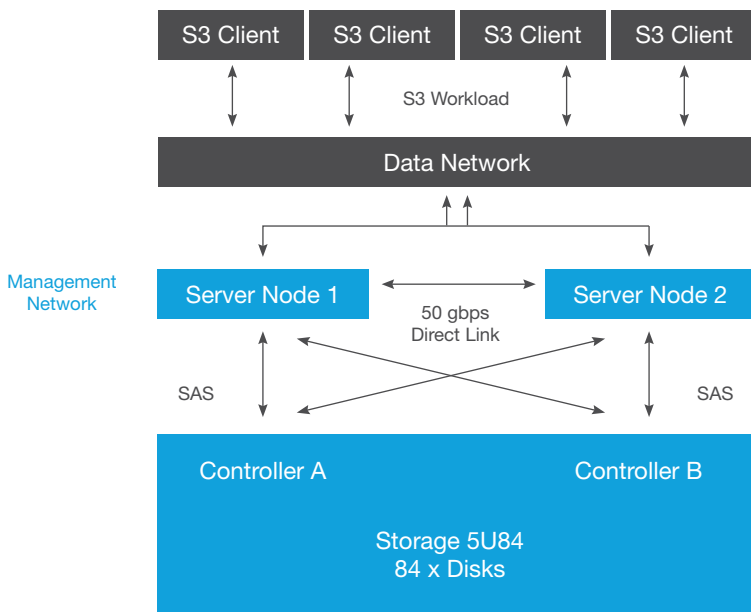

FIGURE 2

Lyve Drive Rack supports only S3 in its first release. The diagram shows how CORTX benefits from a tighter integration with storage. CORTX enables the data to communicate directly with the storage drives without an intervening file system. This direct-to-drive architectural feature improves performance and reliability while granting better control over storage drives.

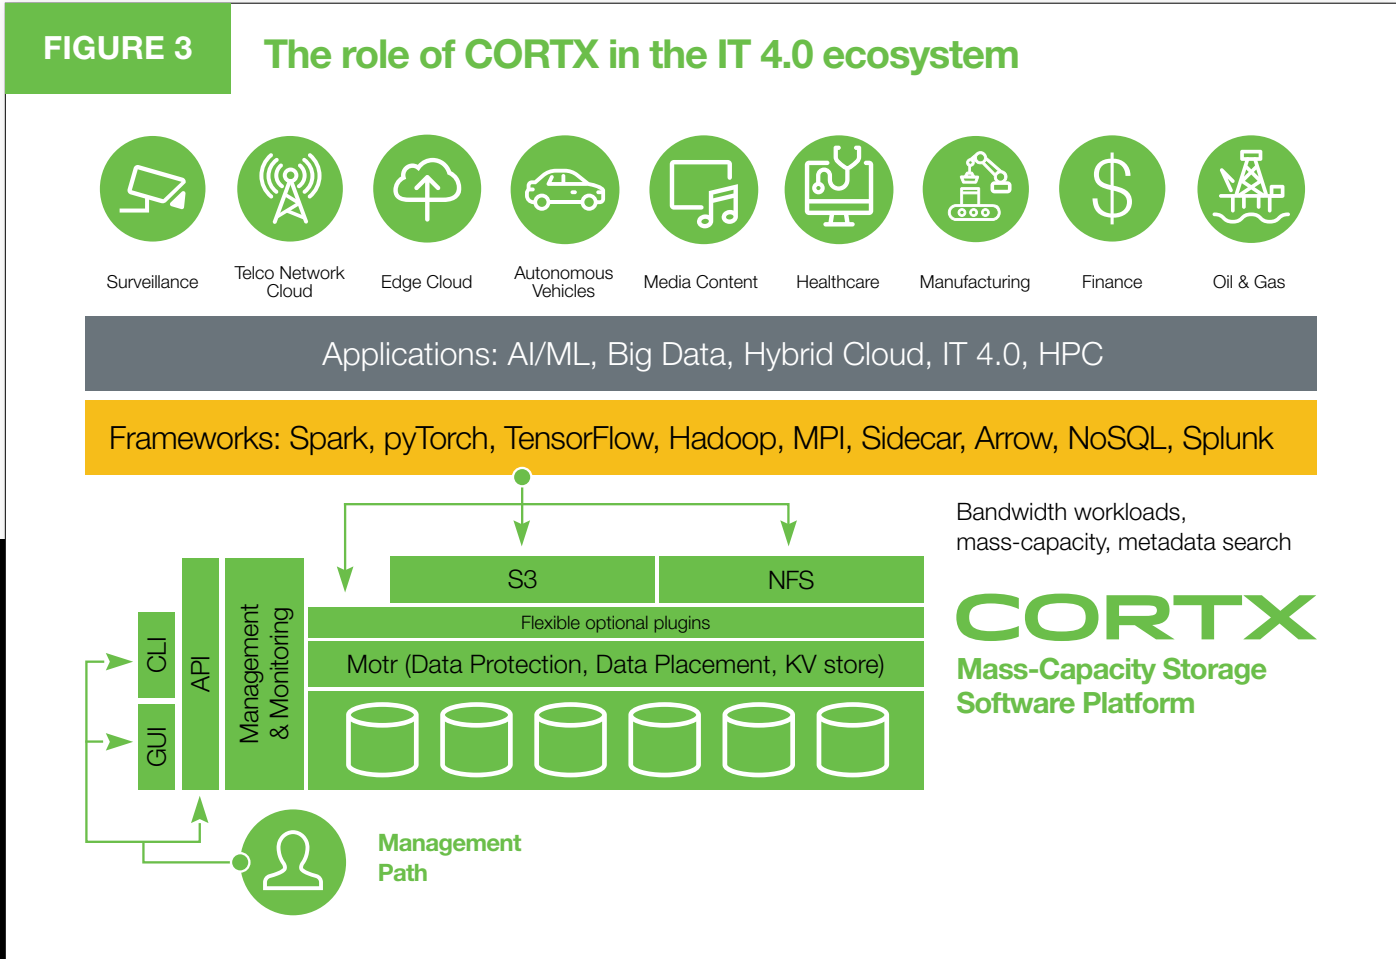

Figure 2 gives a little more detail on how the hardware components of Lyve Drive Rack are connected.

Lyve Drive Rack hardware consists of large-capacity storage that is accessed from two identical servers using SAS data links. The servers themselves keep in sync with a 50Gb/s direct

network link between them. Each server has a 50Gb/s data link to the external environment, as well. The S3 clients from the world can access the system via a 100Gb/s switch.

The architecture diagram in Figure 3 shows how CORTX can function as a core software component of modern data centers.

Different user applications can be deployed on top of CORTX—all accessing data in various ways, but still working on the same base set of objects, without data copies or physical segmentation of the persistent data store. CORTX provides a common metadata format to allow protocols using CORTX to access the same data/objects. Developing on the CORTX platform is done via the standard Amazon S3. Special support for key-value store is also available using the native libCORTX API.

### Reference Architecture Main Components:
