| Rev B, 06/22/2017 | 7 & 10: Updated Max Height to 20.20mm/0.795 in.  
20: Updated Max Height in Figure 2: Mounting dimensions (1 and 2-disk models) |
| Rev C, 10/18/2017 | 12: Added Figure 1: Location of the HDA temperature check point  
15-18: Updated Safety, EMC, FCC & RoHS Sections 2.12 through 2.13.3, per Compliance Council  
20: Corrected fastener penetration depth to 0.140 inches in Section 3.4 & Figures 3 |
| Rev D, 04/13/2018 | 15: Added Regulatory Model Number  
18: Corrected characters in Table 6: Taiwan - Restricted Substances |
| Rev E, 06/06/2018 | 7: Updated Heads & Disks  
7 & 9: Added Spindle speed= 7200 RPM  
7 & 9: Updated weight  
7 & 10: Updated Start/Stop times  
8 & 13: Updated Acoustics  
10: Updated Power table  
27: Updated Word 217 Value to 1C20H |
| Rev F, 08/06/2018 | 10 & 20: Removed (1-disk) references  
18: Updated Table 6: Taiwan - Restricted Substances |
| Rev G, 05/28/2019 | 6: Removed TGMR Bullet  
bc: Removed APAC & EMEA addresses |
| Rev H, 07/109/2019 | 8: Revised Non-recoverable read errors to 10E14 |
| Rev J, 05/13/2020 | 9: Section 2.4 Recording and interface technology, changed to - Recording technology = SMR  
10: Updated Section 2.7.2 Conducted noise  
15: Replaced Regulatory Compliance and Safety information with URL and instructions  
15: Renamed Section 2.12.1 to Regulatory models |
| Rev K, 09/17/2020 | fc, 6-10, 13 & 23-24: Added 1TB model number & updated capacity references  
8 & 13: Updated Acoustic Seek values to typ 3.1 and max 3.3 bels  
15: Updated Section 2.12 HDD and SSD Regulatory Compliance and Safety text |
| Rev L, 12/14/2020 | 10: Conducted noise - changed square-wave to sine-wave  
14: Removed ENV50204-95 and updated Radiated RF immunity.  
17: Screw torque value = 8 in-lbs max |

1.0 Introduction

This manual describes the functional, mechanical and interface specifications for the following Seagate® BarraCuda® model drives:

ST2000DM008      ST1000DM014

These drives provide the following key features:
• Compliant with RoHS requirements in China and Europe.
• High instantaneous (burst) data-transfer rates (up to 600MB per second).
• Native Command Queuing with command ordering to increase performance in demanding applications.
• Quiet operation.
• SeaTools™ diagnostic software performs a drive self-test that eliminates unnecessary drive returns.
• State-of-the-art cache and on-the-fly error-correction algorithms.
• Support for S.M.A.R.T. drive monitoring and reporting.
• Supports latching SATA cables and connectors.
• Worldwide Name (WWN) capability uniquely identifies the drive.

1.1 About the SATA interface

The Serial ATA (SATA) interface provides several advantages over the traditional (parallel) ATA interface. The primary advantages include:
• Easy installation and configuration with true plug-and-play connectivity. It is not necessary to set any jumpers or other configuration options.
• Thinner and more flexible cabling for improved enclosure airflow and ease of installation.
• Scalability to higher performance levels.

In addition, SATA makes the transition from parallel ATA easy by providing legacy software support. SATA was designed to allow users to install a SATA host adapter and SATA disk drive in the current system and expect all of the existing applications to work as normal.

The SATA interface connects each disk drive in a point-to-point configuration with the SATA host adapter. There is no master/slave relationship with SATA devices like there is with parallel ATA. If two drives are attached on one SATA host adapter, the host operating system views the two devices as if they were both “masters” on two separate ports. This essentially means both drives behave as if they are Device 0 (master) devices.

The SATA host adapter and drive share the function of emulating parallel ATA device behavior to provide backward compatibility with existing host systems and software. The Command and Control Block registers, PIO and DMA data transfers, resets, and interrupts are all emulated.

The SATA host adapter contains a set of registers that shadow the contents of the traditional device registers, referred to as the Shadow Register Block. All SATA devices behave like Device 0 devices. For additional information about how SATA emulates parallel ATA, refer to the “Serial ATA International Organization: Serial ATA Revision 3.0”. The specification can be downloaded from www.sata-io.org.

Note

The host adapter may, optionally, emulate a master/slave environment to host software where two devices on separate SATA ports are represented to host software as a Device 0 (master) and Device 1 (slave) accessed at the same set of host bus addresses. A host adapter that emulates a master/slave environment manages two sets of shadow registers. This is not a typical SATA environment.
2.0 Drive Specifications

Unless otherwise noted, all specifications are measured under ambient conditions, at 25°C, and nominal power. For convenience, the phrases the drive and this drive are used throughout this manual to indicate the following drive models:

ST2000DM008 ST1000DM014

2.1 Specification summary tables

The specifications listed in Table 1 are for quick reference. For details on specification measurement or definition, refer to the appropriate section of this manual.

<td>600,000 at 25°C, 50% rel. humidity</td>
</tr>
<tr>
<td>Supports hotplug operation per the Serial ATA Revision 3.2 specification</td>
<td>Yes</td>
</tr>
</tbody>
</table>

* All specifications above are based on native configurations.

** One GB equals one billion bytes and 1TB equals one trillion bytes when referring to hard drive capacity. Accessible capacity may vary depending on operating environment and formatting.

*** During periods of drive idle, some offline activity may occur according to the S.M.A.R.T. specification, which may increase acoustic and power to operational levels.

† Seagate does not recommend operating at sustained case temperatures above 60°C. Operating at higher temperatures will reduce useful life of the product.

**Note** If the drive is powered-off before issuing flush cache command, in some instances, the end user data in the DRAM cache might not be committed to the disk.
2.2 Formatted capacity

<table>
<thead>

</tbody>
</table>

*One GB equals one billion bytes and 1TB equals one trillion bytes when referring to hard drive capacity. Accessible capacity may vary depending on operating environment and formatting.

2.2.1 LBA mode

When addressing these drives in LBA mode, all blocks (sectors) are consecutively numbered from 0 to \( n-1 \), where \( n \) is the number of guaranteed sectors as defined above.

See Section 4.3.1, "Identify Device command" (words 60-61 and 100-103) for additional information about 48-bit addressing support of drives with capacities over 137GB.

2.3 Default logical geometry

- **Cylinders**: 16,383
- **Read/write heads**: 16
- **Sectors per track**: 63

LBA mode

When addressing these drives in LBA mode, all blocks (sectors) are consecutively numbered from 0 to \( n-1 \), where \( n \) is the number of guaranteed sectors as defined above.

2.4 Recording and interface technology

<table>
<thead>
<tr>

</tbody>
</table>

2.5 Physical characteristics

| Maximum height      | 20.20mm / 0.795 in |
| Maximum width       | 101.6mm / 4.0 in (± 0.010 in) |
| Maximum length      | 146.99mm / 5.787 in |
| Typical weight      | 490g / 1.08 lb    |
| Cache buffer        | 256MB           |
2.6 Start/stop times
The start/stop times are listed below.

<table>
<thead>
<tr>
<th></th>
<th>ST2000DM008 and ST1000DM014</th>
</tr>
</thead>
<tbody>
<tr>
<td>Power-on to ready</td>
<td>11 (typical)</td>
</tr>
<tr>
<td>(in seconds)</td>
<td></td>
</tr>
<tr>
<td>Standby to ready</td>
<td>11 (typical)</td>
</tr>
<tr>
<td>(in seconds)</td>
<td></td>
</tr>
<tr>
<td>Ready to spindle stop</td>
<td>11 (typical)</td>
</tr>
<tr>
<td>(in seconds)</td>
<td></td>
</tr>
</tbody>
</table>

Time-to-ready may be longer than normal if the drive power is removed without going through normal OS powerdown procedures.

2.7 Power specifications
The drive receives DC power (+5V or +12V) through a native SATA power connector. Refer to Figure 2 on page 16.

2.7.1 Power consumption
Power requirements for the drives are listed in Table 2. Typical power measurements are based on an average of drives tested, under nominal conditions, using 5.0V and 12.0V input voltage at 25°C ambient temperature. These power measurements are done with DIPM enabled.

- Spinup current is measured from the time of power-on to the time that the drive spindle reaches operating speed.
- Read/Write current is measured with the heads on track, based on three 64 sector read or write operations every 100 ms.
- The drive supports three idle modes: Performance Idle mode, Active Idle mode and Low Power Idle mode. Refer to Section 2.7.4 for power-management modes.

<table>
<thead>
<tr>
<th>Power dissipation</th>
<th>Avg (watts 25° C)</th>
<th>Avg 12V typ amps</th>

</tr>
<tr>
<td>Sleep</td>
<td>0.3</td>
<td></td>
</tr>
</tbody>
</table>

2.7.2 Conducted noise
Input noise ripple is measured at the host system power supply across an equivalent 80-ohm resistive load on the +12 volt line or an equivalent 15-ohm resistive load on the +5 volt line.

- Using 12-volt power, the drive is expected to operate with a maximum of 200 mV peak-to-peak sine-wave injected noise at up to 10MHz.
- Using 5-volt power, the drive is expected to operate with a maximum of 150 mV peak-to-peak sine-wave injected noise at up to 10MHz.

Note: Equivalent resistance is calculated by dividing the nominal voltage by the typical RMS read/write current.
2.7.3 Voltage tolerance

Voltage tolerance (including noise):
- 5V ±5%
- 12V ±10%

2.7.4 Power-management modes

The drive provides programmable power management to provide greater energy efficiency. In most systems, users can control power management through the system setup program. The drive features the following power-management modes:

<table>
<thead>
<tr>
<th>Power modes</th>
<th>Heads</th>
<th>Spindle</th>
<th>Electronics</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Tracking</td>
<td>Rotating</td>
<td>Full Power</td>
</tr>
<tr>
<td>Idle, Performance</td>
<td>Tracking</td>
<td>Rotating</td>
<td>Full Power</td>

<tr>
<td>Idle, Active</td>
<td>Floating</td>
<td>Rotating</td>
<td>Partial Power</td>
</tr>
<tr>
<td>Idle, Low Power</td>
<td>Parked</td>
<td>Rotating</td>
<td>Partial Power</td>
</tr>
<tr>
<td>Standby</td>
<td>Parked</td>
<td>Stopped</td>
<td>Low Power</td>
</tr>
<tr>
<td>Sleep</td>
<td>Parked</td>
<td>Stopped</td>
<td>Low Power</td>
</tr>
</tbody>
</table>

- **Active mode**
  The drive is in Active mode during the read/write and seek operations.

- **Idle mode**
  The electronics remain powered, and the drive accepts all commands and returns to Active mode when disk access is necessary.

- **Standby mode**
  The drive enters Standby mode immediately when the host sends a Standby Immediate command. If the host has set the standby timer, the drive enters Standby mode automatically after the drive has been inactive for a specifiable length of time. The standby timer delay is established using a Standby or Idle command. In Standby mode, the electronics are in low power mode, the heads are parked and the spindle is at rest. The drive accepts all commands and returns to Active mode when disk access is necessary.

- **Sleep mode**
  The drive enters Sleep mode after receiving a Sleep command from the host. In Sleep mode, the electronics are in low power mode, the heads are parked and the spindle is at rest. The drive leaves Sleep mode after it receives a Hard Reset or Soft Reset from the host. After receiving a reset, the drive exits Sleep mode and enters Standby mode.

- **Idle and Standby timers**
  Each time the drive performs an Active function (read, write or seek), the standby timer is reinitialized and begins counting down from its specified delay times to zero. If the standby timer reaches zero before any drive activity is required, the drive makes a transition to Standby mode. In both Idle and Standby mode, the drive accepts all commands and returns to Active mode when disk access is necessary.
2.8 Environmental specifications

This section provides the temperature, humidity, shock, and vibration specifications for Barracuda drives. Ambient temperature is defined as the temperature of the environment immediately surrounding the drive. Above 1000ft. (305 meters), the maximum temperature is derated linearly by 1°C every 1000 ft. Refer to Section 3.4 on page 17 for base plate measurement location.

2.8.1 Ambient Temperature

<table>
<thead>
<tr>
<th></th>
<th>Operating (Ambient)</th>

</tr>
</tbody>
</table>
2.8.5 Shock and Vibration

All shock specifications assume that the drive is mounted securely with the input shock applied at the drive mounting screws. Shock may be applied in the X, Y or Z axis.

2.8.5.1 Operating shock

These drives comply with the performance levels specified in this document when subjected to a maximum operating shock of 80 Gs (read) / 70 Gs (write) based on half-sine shock pulses of 2ms during read operations. Shocks should not be repeated more than two times per second.

2.8.5.2 Non-operating shock

The non-operating shock level that the drive can experience without incurring physical damage or degradation in performance when subsequently put into operation is 350 Gs based on a non-repetitive half-sine shock pulse of 2ms duration.

2.8.5.3 Operating vibration

The maximum vibration levels that the drive may experience while meeting the performance standards specified in this document are specified below.

<table>
<thead>
<tr>
<th>Frequency Range</th>
<th>Vibration Level (Gs)</th>
</tr>
</thead>
<tbody>
<tr>
<td>10Hz to 22Hz</td>
<td>0.25 Gs (Limited displacement)</td>
</tr>
<tr>
<td>22Hz to 350Hz</td>
<td>0.50 Gs</td>
</tr>
<tr>
<td>350Hz to 500Hz</td>
<td>0.25 Gs</td>
</tr>
</tbody>
</table>

All vibration specifications assume that the drive is mounted securely with the input vibration applied at the drive mounting screws. Vibration may be applied in the X, Y or Z axis. Throughput may vary if improperly mounted.

2.8.6 Non-operating vibration

The maximum non-operating vibration levels that the drive may experience without incurring physical damage or degradation in performance when subsequently put into operation are specified below.

<table>
<thead>
<tr>
<th>Frequency Range</th>
<th>Vibration Level (Gs)</th>
</tr>
</thead>

</table>

2.9 Acoustics

Drive acoustics are measured as overall A-weighted acoustic sound power levels (no pure tones). All measurements are consistent with ISO document 7779. Sound power measurements are taken under essentially free-field conditions over a reflecting plane. For all tests, the drive is oriented with the cover facing upward.

Table 3 Fluid Dynamic Bearing (FDB) motor acoustics

<table>

<td></td>
<td>2.9 bels (max)</td>
<td>3.3 bels (max)</td>
</tr>
</tbody>
</table>

*During periods of drive idle, some offline activity may occur according to the S.M.A.R.T. specification, which may increase acoustic and power to operational levels.
2.9.1 Test for Prominent Discrete Tones (PDTs)

Seagate follows the ECMA-74 standards for measurement and identification of PDTs. An exception to this process is the use of the absolute threshold of hearing. Seagate uses this threshold curve (originated in ISO 389-7) to discern tone audibility and to compensate for the inaudible components of sound prior to computation of tone ratios according to Annex D of the ECMA-74 standards.

2.10 Electromagnetic immunity

When properly installed in a representative host system, the drive operates without errors or degradation in performance when subjected to the radio frequency (RF) environments defined in Table 4.

2.11 Warranty

To determine the warranty for a specific drive, use a web browser to access the following web page: www.seagate.com/support/warranty-and-replacements/

From this page, click on “Is my Drive under Warranty”. Users will be asked to provide the drive serial number, model number (or part number) and country of purchase. The system will display the warranty information for the drive.
2.11.1 Storage

Maximum storage periods are 180 days within original unopened Seagate shipping package or 60 days unpackaged within the defined non-operating limits (refer to environmental section in this manual). Storage can be extended to 1 year packaged or unpackaged under optimal environmental conditions (25°C, <40% relative humidity non-condensing, and non-corrosive environment). During any storage period the drive non-operational temperature, humidity, wet bulb, atmospheric conditions, shock, vibration, magnetic and electrical field specifications should be followed.

2.11.2 Data loss under power interruption with write cache enabled

Drive preserves its data during all operations except in cases where power to the drive is interrupted during write operations. This could result in either an uncorrected data error being reported, or the entire sector/track becoming unreadable. This can be permanently recovered by rewriting to the same location on the drive. Additionally any data present in the DRAM buffer will not be written to the disk media, additionally, the drive will not be able to return the original data.

In order to prevent this data loss, the host should issue a standby immediate or flush cache command before a controlled power off operation to the drive.

2.12 HDD and SSD Regulatory Compliance and Safety

For the latest regulatory and compliance information see: www.seagate.com/support/ scroll down the page and click the Compliance, Safety and Disposal Guide link.

2.12.1 Regulatory models

The following regulatory model number represent all features and configurations within the series:

Regulatory Model Numbers: SKR005

2.13 Corrosive environment

Seagate electronic drive components pass accelerated corrosion testing equivalent to 10 years exposure to light industrial environments containing sulfurous gases, chlorine and nitric oxide, classes G and H per ASTM B845. However, this accelerated testing cannot duplicate every potential application environment. Users should use caution exposing any electronic components to uncontrolled chemical pollutants and corrosive chemicals as electronic drive component reliability can be affected by the installation environment. The silver, copper, nickel and gold films used in Seagate products are especially sensitive to the presence of sulfide, chloride, and nitrate contaminants. Sulfur is found to be the most damaging. In addition, electronic components should never be exposed to condensing water on the surface of the printed circuit board assembly (PCBA) or exposed to an ambient relative humidity greater than 95%. Materials used in cabinet fabrication, such as vulcanized rubber, that can outgas corrosive compounds should be minimized or eliminated. The useful life of any electronic equipment may be extended by replacing materials near circuitry with sulfide-free alternatives.
3.0 Configuring and Mounting the Drive

This section contains the specifications and instructions for configuring and mounting the drive.

3.1 Handling and static-discharge precautions

After unpacking, and before installation, the drive may be exposed to potential handling and electrostatic discharge (ESD) hazards. Observe the following standard handling and static-discharge precautions:

- Before handling the drive, put on a grounded wrist strap, or ground oneself frequently by touching the metal chassis of a computer that is plugged into a grounded outlet. Wear a grounded wrist strap throughout the entire installation procedure.
- Handle the drive by its edges or frame only.
- The drive is extremely fragile—handle it with care. Do not press down on the drive top cover.
- Always rest the drive on a padded, antistatic surface until mounting it in the computer.
- Do not touch the connector pins or the printed circuit board.
- Do not remove the factory-installed labels from the drive or cover them with additional labels. Removal voids the warranty. Some factory-installed labels contain information needed to service the drive. Other labels are used to seal out dirt and contamination.

3.2 Configuring the drive

Each drive on the SATA interface connects point-to-point with the SATA host adapter. There is no master/slave relationship because each drive is considered a master in a point-to-point relationship. If two drives are attached on one SATA host adapter, the host operating system views the two devices as if they were both “masters” on two separate ports. Both drives behave as if they are Device 0 (master) devices.

SATA drives are designed for easy installation. It is usually not necessary to set any jumpers on the drive for proper operation; however, if users connect the drive and receive a “drive not detected” error, the SATA-equipped motherboard or host adapter may use a chipset that does not support SATA speed autonegotiation.

3.3 SATA cables and connectors

The SATA interface cable consists of four conductors in two differential pairs, plus three ground connections. The cable size may be 30 to 26 AWG with a maximum length of one meter (39.37 inches). See Table 5 for connector pin definitions. Either end of the SATA signal cable can be attached to the drive or host.

For direct backplane connection, the drive connectors are inserted directly into the host receptacle. The drive and the host receptacle incorporate features that enable the direct connection to be hot pluggable and blind mateable.

For installations which require cables, users can connect the drive as illustrated in Figure 2.

Figure 2 Attaching SATA cabling

Each cable is keyed to ensure correct orientation. Seagate BarraCuda drives support latching SATA connectors.
### 3.4 Drive mounting

Users can mount the drive in any orientation using four screws in the side-mounting holes or four screws in the bottom-mounting holes. Refer to Figure 3 for drive mounting dimensions. Follow these important mounting precautions when mounting the drive:

- Allow a minimum clearance of 0.030 inches (0.76mm) around the entire perimeter of the drive for cooling.
- Use only 6-32 UNC mounting screws.
- The screws should be inserted no more than 0.140 inch (3.56 mm) into the bottom or side mounting holes.
- Do not overtighten the mounting screws (maximum torque: 8 inch-lbs max).

*Figure 3 Mounting dimensions*
4.0 SATA Interface

These drives use the industry-standard Serial ATA (SATA) interface that supports FIS data transfers. It supports ATA programmed input/output (PIO) modes 0 to 4; multiword DMA modes 0 to 2, and Ultra DMA modes 0 to 6.

For detailed information about the SATA interface, refer to the “Serial ATA: High Speed Serialized AT Attachment” specification.

4.1 Hot-Plug compatibility

Seagate BarraCuda drives incorporate connectors which enable users to hot plug these drives in accordance with the SATA Revision 3.2 specification. This specification can be downloaded from www.serialata.org.

4.2 SATA device plug connector pin definitions

Table 5 summarizes the signals on the SATA interface and power connectors.

</tbody>
</table>

Notes

1. All pins are in a single row, with a 1.27 mm (0.050 in) pitch.
2. The comments on the mating sequence apply to the case of backplane blindmate connector only. In this case, the mating sequences are:
   - the ground pins P4 and P12.
   - the pre-charge power pins and the other ground pins.
   - the signal pins and the rest of the power pins.
3. There are three power pins for each voltage. One pin from each voltage is used for pre-charge when installed in a blind-mate backplane configuration.
   - All used voltage pins (Vx) must be terminated.
### 4.3 Supported ATA commands

The following table lists SATA standard commands that the drive supports. For a detailed description of the ATA commands, refer to the Serial ATA International Organization: Serial ATA Revision 3.0 (www.sata-io.org).

4.3.1 Identify Device command

The Identify Device command (command code ECH) transfers information about the drive to the host following power up. The data is organized as a single 512-byte block of data, whose contents are shown in “Supported ATA commands” on page 19. All reserved bits or words should be set to zero. Parameters listed with an "x" are drive-specific or vary with the state of the drive.

The following commands contain drive-specific features that may not be included in the SATA specification.

<table>

4.3.2 Set Features command

This command controls the implementation of various features that the drive supports. When the drive receives this command, it sets BSY, checks the contents of the Features register, clears BSY and generates an interrupt. If the value in the register does not represent a feature that the drive supports, the command is aborted. Power-on default has the read look-ahead and write caching features enabled. The acceptable values for the Features register are defined as follows:

<table>
<thead>
<tr>
<th>Value (Hex)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>02H</td>
<td>Enable write cache <em>(default)</em></td>
</tr>
<tr>
<td>03H</td>
<td>Set transfer mode (based on value in Sector Count register)</td>
</tr>
<tr>
<td></td>
<td>Sector Count register values:</td>
</tr>
<tr>
<td>00H</td>
<td>Set PIO mode to default (PIO mode 2)</td>
</tr>
<tr>
<td>01H</td>
<td>Set PIO mode to default and disable IORDY (PIO mode 2)</td>
</tr>
<tr>
<td>08H</td>
<td>PIO mode 0</td>
</tr>
<tr>
<td>09H</td>
<td>PIO mode 1</td>
</tr>
<tr>
<td>0AH</td>
<td>PIO mode 2 <em>(default)</em></td>
</tr>
<tr>
<td>0BH</td>
<td>PIO mode 3</td>
</tr>
<tr>
<td>0CH</td>
<td>PIO mode 4 <em>(default)</em></td>
</tr>
<tr>
<td>20H</td>
<td>Multiword DMA mode 0</td>
</tr>
<tr>
<td>21H</td>
<td>Multiword DMA mode 1</td>
</tr>
<tr>
<td>22H</td>
<td>Multiword DMA mode 2</td>
</tr>
<tr>
<td>40H</td>
<td>Ultra DMA mode 0</td>
</tr>
<tr>
<td>41H</td>
<td>Ultra DMA mode 1</td>
</tr>
<tr>
<td>42H</td>
<td>Ultra DMA mode 2</td>
</tr>
<tr>
<td>43H</td>
<td>Ultra DMA mode 3</td>
</tr>
<tr>
<td>44H</td>
<td>Ultra DMA mode 4</td>
</tr>
<tr>
<td>45H</td>
<td>Ultra DMA mode 5</td>
</tr>
<tr>
<td>46H</td>
<td>Ultra DMA mode 6</td>
</tr>
<tr>
<td>06H</td>
<td>Enable the PUIS feature set</td>
</tr>
<tr>
<td>07H</td>
<td>PUIS feature set device spin-up</td>
</tr>
<tr>
<td>10H</td>
<td>Enable use of SATA features</td>
</tr>
<tr>
<td>55H</td>
<td>Disable read look-ahead (read cache) feature</td>
</tr>
<tr>
<td>82H</td>
<td>Disable write cache</td>
</tr>
<tr>
<td>86H</td>
<td>Disable the PUIS feature set</td>
</tr>
<tr>
<td>90H</td>
<td>Disable use of SATA features</td>
</tr>
<tr>
<td>AAH</td>
<td>Enable read look-ahead (read cache) feature <em>(default)</em></td>
</tr>
<tr>
<td>F1H</td>
<td>Report full capacity available</td>
</tr>
</tbody>
</table>

**Note**
At power-on, or after a hardware or software reset, the default values of the features are as indicated above.
4.3.3 S.M.A.R.T. commands

S.M.A.R.T. provides near-term failure prediction for disk drives. When S.M.A.R.T. is enabled, the drive monitors predetermined drive attributes that are susceptible to degradation over time. If self-monitoring determines that a failure is likely, S.M.A.R.T. makes a status report available to the host. Not all failures are predictable. S.M.A.R.T. predictability is limited to the attributes the drive can monitor. For more information on S.M.A.R.T. commands and implementation, see the Draft ATA-5 Standard.

SeaTools diagnostic software activates a built-in drive self-test (DST S.M.A.R.T. command for D4H) that eliminates unnecessary drive returns. The diagnostic software ships with all new drives and is also available at: seatools.seagate.com.

This drive is shipped with S.M.A.R.T. features disabled. Users must have a recent BIOS or software package that supports S.M.A.R.T. to enable this feature. The table below shows the S.M.A.R.T. command codes that the drive uses.

<table>
<thead>
<tr>
<th>Code in features register</th>
<th>S.M.A.R.T. command</th>
</tr>
</thead>
<tbody>
<tr>
<td>D0H</td>
<td>S.M.A.R.T. Read Data</td>
</tr>
<tr>
<td>D1H</td>
<td>S.M.A.R.T. Read Attribute Threshold</td>
</tr>
<tr>
<td>D2H</td>
<td>S.M.A.R.T. Enable/Disable Attribute Autosave</td>
</tr>
<tr>
<td>D3H</td>
<td>S.M.A.R.T. Save Attribute Values</td>
</tr>
<tr>
<td>D4H</td>
<td>S.M.A.R.T. Execute Off-line Immediate (runs DST)</td>
</tr>
<tr>
<td>D5H</td>
<td>S.M.A.R.T. Read Log Sector</td>
</tr>
<tr>
<td>D6H</td>
<td>S.M.A.R.T. Write Log Sector</td>
</tr>
<tr>
<td>D8H</td>
<td>S.M.A.R.T. Enable Operations</td>
</tr>
<tr>
<td>D9H</td>
<td>S.M.A.R.T. Disable Operations</td>
</tr>
<tr>
<td>DAH</td>
<td>S.M.A.R.T. Return Status</td>
</tr>
</tbody>
</table>

Note: If an appropriate code is not written to the Features Register, the command is aborted and 0x04 (abort) is written to the Error register.
